(Egypt, Sudan, Ethiopia, Djibouti, Eritrea, Somalia, Kenya, Uganda, Tanzania, Rwanda, Burundi and the Democratic Republic of Congo) covering an area of over 9.5 million km². Being the first operational module of the AFRICOVER program, the AFRICOVER-EA has developed the whole methodological approach for the so-called “MADE” Multipurpose AFRICOVER Data base for Environmental resources. This work resulted in spin-off developments of great importance:

- A complex interpretation chain tested and continuously refined during the whole project activity.
- A detailed set of cartographic standards to homogenise the interpretation process and to facilitate and enhance the utilisation of the database.
- The development (both theoretical and practical) of the “AFRICOVER Interpretation Tools”: Land Cover Classification System (LCCS), AFRICOVER Interpretation and Mapping System (AIMS), Geographic Vector Interpretation System (GeoVIS)
- The development of the “AFRICOVER End User Tools”: AFRICOVER Database Gateway (ADG), AFRICOVER Interactive Data-base for interpretation (AID).

Completion of the AFRICOVER-EA project is planned in December 2002; the inventory of the potential users of its products has been completed and a potential client network established. The AFRICOVER-EA project, when successfully completed, will thus contribute to a more effective and efficient management of renewable natural resources and environmental protection in East Africa.

1. Introduction

Current land cover is essential information for a reliable environmental database. Land cover is the expression of human activities and as such changes with alteration in these. Hence, land cover is a geographical feature which may form a reference base for applications ranging from forest and rangeland monitoring, production of statistics, planning, investment, biodiversity, climate change, to desertification control. Despite the high demand for such types of information in most developing countries, the data is usually missing, outdated or not consistent.

The AFRICOVER project was initiated by the Food and Agriculture Organisation of the United Nations (FAO) on the request of several African countries to provide accurate and reliable land cover information, based on a systematic and harmonised land cover classification system and on uniform cartographic and mapping specifications for the whole continent of Africa.

The main product consists of a detailed digital land cover and basic topographic layer (roads, rivers, toponymy, international and administrative boundaries) digital database. Map production methodologies and facilities, land cover classification and mapping methodologies, GIS, image analysis and cartographic equipment, and training of national staff are by-products of AFRICOVER mapping activities.
